1. Summary

The clinical performance of CLUNGENE® COVID-19 Antigen Rapid Test for self-testing was evaluated in a prospective study in Greece between June 2021 and July 2021. A total of 578 subjects (122 were symptomatic and 456 were asymptomatic at time of presentation) were enrolled at four collection sites in Attica. The subjects included in the study were provided instructions for use in Greek and the rapid test kit. No additional training or instructions were provided. Self-sampling with fresh nasal swabs and self-testing occurred in subjects' home or home-like environment. The processes were observed and recorded without intervention. The professional sampling with nasopharyngeal swabs were sent on cold packs to the Locus Medicus laboratory in Athens for SARS-CoV-2 RT-PCR testing. 30 RT-PCR positive samples were subjected to a typing assay to identify which variant it is, so as to verify CLUNGENE® COVID-19 Antigen Rapid Test can identify the most current variant. The sensitivity and specificity of CLUNGENE® COVID-19 Antigen Rapid Test relative to the RT-PCR test were calculated, and its usability was evaluated by the statistical results based on the questionnaires.

The CLUNGENE® COVID-19 Antigen Rapid Test showed a sensitivity of 95.1% (95%CI: 89.7%-97.7%) and a specificity of 100% (95%CI: 95%CI: 99.2%-100%) compared to gold-standard RT-PCR. This test can accurately identify Alpha, Beta and Delta variants.

4 questionnaires were not counted in the usability statistics because they were incomplete. 98.4% of participants were able to perform the test in a manner that does not cause a safety hazard; 97.2% of the participants were able to read test results correctly; 96.2% of the participants could correctly interpret what to do next in case of a positive/negative/invalid test result; 89.9% of the participants were able to understand the instructions for use. 97.7% (561/574) of participants were satisfied with the product.

The clinical performance and usability of CLUNGENE® COVID-19 Antigen Rapid Test successfully meet the acceptance criteria specified in the clinical investigation plan. Notably, the CLUNGENE® COVID-19 Antigen Rapid Test meet the acceptance criteria of >80% sensitivity and >98% specificity defined by the Medical Device Coordination Group (MDCG) [3]. This study demonstrate that individuals aged 15 years or older can reliably perform the CLUNGENE® COVID-19 Antigen Rapid Test by themselves, and the adult lay users can reliably test another person under 15 years of age.

2. Introduction

2.1 Intended use

The CLUNGENE® COVID-19 Antigen Rapid Test is a lateral flow immunoassay intended for the qualitative detection of SARS-CoV-2 nucleocapsid antigens in nasal swab. This test is intended for self-use by individuals aged 15 years or older and, as applicable for an adult lay user testing another person under 15 years of age. Individuals over 65 years of age should seek assistance in performing test.

The test provides only a preliminary screen test result.

2.2 Testing principle

CLUNGENE® COVID-19 Antigen Rapid Test is based on the technique of lateral flow immunoassay, which applies the principle of the double-antibody sandwich. SARS-CoV-2 nucleocapsid protein

monoclonal antibody conjugated with color microparticles is used as detector and sprayed on conjugation pad. During the test, SARS-CoV-2 antigen in the specimen interacts with SARS-CoV-2 antibody conjugated with color microparticles making antigen-antibody labeled complex. This complex migrates on the membrane via capillary action until the test line, where it will be captured by the pre-coated SARS-CoV-2 nucleocapsid protein monoclonal antibody. A colored test line (T) would be visible in the result window if SARS-CoV-2 antigens are present in the specimen. Absence of the T line suggests a negative result. The control line (C) is used for procedural control and should always appear if the test procedure is performed properly.

3. Rationale and objectives

The aim of this study is to determine the diagnostic sensitivity and diagnostic specificity of CLUNGENE® COVID-19 Antigen Rapid Test compared to gold-standard RT-PCR, and to assess the usability of CLUNGENE® COVID-19 Antigen Rapid Test for layperson.

If CLUNGENE® COVID-19 Antigen Rapid Test is shown to have sufficient sensitivity and specificity, then this device could contribute to overall COVID-19 testing capacity, offering advantages in terms of shorter turnaround times and reduced costs.

4. Study design

This is a prospective clinical study. Participants are sequentially enrolled at collection site(s) until the sample size is achieved.

Self-sampling with nasal swabs and self-testing are conducted by participants using CLUNGENE® COVID-19 Antigen Rapid Test. The processes will be observed and recorded without intervention. The usability will be evaluated by the statistical results based on the questionnaires.

For comparison, to each of the participants, regardless of the results of its self-testing, a RT-PCR test will be performed in a qualified laboratory by professional sampling with nasopharyngeal swabs and by professional testing according to the standard procedure. To verify the performance on the genetic variant case, a portion of RT-PCR positive samples will be sent to a qualified laboratory for typing assay. The sensitivity and specificity of CLUNGENE® COVID-19 Antigen Rapid Test relative to the RT-PCR test will be calculated.

Based on the minimum performance requirements of SARS-CoV-2 antigen rapid tests published by the World Health Organization (WHO) and the Paul-Ehrlich-Institut (PEI) [1, 2], the acceptance criteria of the sensitivity and specificity of CLUNGENE® COVID-19 Antigen Rapid Test was specified as follows:

- Sensitivity >80%
- Specificity >97%

Based on previous experiences, the acceptance criteria of the usability of CLUNGENE® COVID-19 Antigen Rapid Test was specified as follows:

- 1) At least 80% of participants are able to perform the test in a manner that does not cause a safety hazard;
- 2) At least 90% of the participants are able to read test results correctly;

- 3) At least 80% of the participants can correctly interpret what to do next in case of a positive/ negative/ invalid test result;
- 4) At least 80% of the participants are able to understand the instructions for use.

5. Test reagent

Manufacturer	Hangzhou Clongene Biotech Co., Ltd.
Test name	CLUNGENE® COVID-19 Antigen Rapid Test
Pack size	Single test per kit
Contents of kit	Test cassette (individually in a foil pouch with desiccant), sterile swab, extraction reagent tube, waste bag and instructions for use
Batch number	2021050163
Valid until	2023-04
Product storage	4-30 °C

6. Comparator/reference method

The clinical performance of CLUNGENE® COVID-19 Antigen Rapid Test was compared to the results from nasopharyngeal swabs collected into 0.5 mL of transport media solution and tested with a RT-PCR test.

RT-PCR: Sacace™ SARS-CoV-2 Real-TM (REF: V435-100FRT) baring the CE mark, manufactured by Sacace Biotechnologies Srl in Italy. It is a multiplex Real-time PCR test for the qualitative detection of SARS-CoV-2 RNA using three targets: N gene specific for SARS-CoV-2, E gene specific for SARS-CoV-2 and region of E gene common for all SARS-like coronaviruses (SARS-CoV, SARS-CoV-2).

LOT F1512S-2-S

7. Test sites and investigators

All participants were recruited consecutively from the following four collection sites in Attica, Greece.

Site 1: 246b Mesogeion Avenue, Athens

60 m² indoor place used as educational/lecture center was used to accommodate participants. Eight separate areas were set for sampling and self-testing purposes, partitioned with curtains to ensure visual and acoustic privacy.

Observer: Georgios Georgioulias, MD

Site 2: 246 Mesogeion Avenue, Athens

There were 4 specially designed areas (ISOBOX located outside of the Locus Medicus Diagnostic Center) were used for sampling and self-testing in way that privacy was ensured.

Observer: Nikolaos Georgakopoulos, MSc – Biologist

Site 3: Patisia/Galatsi area residencies, Attica

Health professional collected samples and observed self-testing visiting participants' apartments in the specific area.

Observer: Vasilis Tsilivakos, MD, PhD

Site 4: Loutsa/Artemida area residencies, Attica

Health professional collected samples and observed self-testing visiting participants' apartments in the specific area.

Observer: Andreas Bitsakos, MSc – Biologist

Sampling for RT-PCR test was supported by adequate highly trained personnel from Locus Medicus Diagnostic Center. RT-PCR test was performed in the Locus Medicus laboratory.

Laboratory: Locus Medicus S.A.

246 Mesogeion Ave.155 61 Holargos, Athens, Greece

The laboratory of Locus Medicus S.A. has been accredited by the Hellenic Accreditation System (ESYD) under the terms of the ELOT EN ISO 15189:2012 (certification no. 621-4) and ELOT EN ISO/IEC 17025:2017 (certification no. 737-3).

8. Study samples

The overall study size should not be less than 500 individuals (all positive and negative), in which:

- i at least 100 RT-PCR positive specimens, collected from symptomatic individuals who were tested within 0~7 days of the onset of symptoms. To validate that CLUNGENE® COVID-19 Antigen Rapid Test could identify the most current variants (Including at least Alpha and Delta), about 30 RT-PCR positive samples will be subjected to a typing assay to identify which variant it is.
- ii at least 100 RT-PCR negative specimens, collected from asymptomatic individuals without a known SARS-CoV-2 exposure.

To the recruitment both males and females of age 7~80 (or older) are expected. Study population should include individuals with following grouping considerations, no less than 20 subjects for each group.

- 7~14 years of age
- 15~65 years of age
- >65 years of age

9. Inclusion/exclusion criteria

Inclusion Criteria:

- ii Age: 7 and above
- ii Symptomatic individuals (within 7 days of onset) who were suspected of COVID-19
- ii Asymptomatic individuals without a known SARS-CoV-2 exposure

- ī Written informed consent of the participant; for children under 18 years of age, informed consent of the parents or legal guardians.

Exclusion Criteria:

- ī Age under 7
- ī Prone to nosebleeds
- ī Laboratory professionals who are proficient in performing rapid lateral flow tests
- ī Healthcare provider
- ī Dyslexia and poor eyesight
- ī Unable to provide informed consent due to mental or cognitive disabilities
- ī Individuals duplicate enrolment

10. Test procedure

10.1 Informed consent

Each participant was verbally informed about the trial, in terms of the processes, duration, potential risks and benefits, but no indications about the use of the device including the instruction for use. If there was no further questions by the subject then each should sign a informed consent.

10.2 Self-sampling and self-testing

After providing written informed consent, the participants received the CLUNGENE® COVID-19 Antigen Rapid Test and a instructions for use in Greek. A mirror for self-sampling and a clock/timer were provided. Participants performed the procedures according to the following testing situations in a separate room/area without time restrictions.

- Parent or legal guardian collected a sample from their child (age 7-14) and parent or legal guardian performed the test.
- Older child (age 15-17) self-collected sample and child performed the test (parent or legal guardian should not be present to intervene).
- Adults (age 18 and older) self-collected the sample and performed the test themselves.

For each subject, there was one observer who watched the process during the operation by the subject, doing investigation after the operation, recording the facts he/she observed, the feedbacks he/she got during the conversation, and a conclusion for each case all on the individual questionnaire. The observer was requested not to provide any help other than referring to the provided instructions for use. Participants were not allowed to use any tools, including cell phones, computers, internet, videos, etc. Participants over 65 years old could seek assistance in performing test, but the details of why he/she need help, how was the test performed should be recorded in the paperbased questionnaire.

10.3 Comparator test

For each participant, nasopharyngeal (NP) swab was collected by professional and placed in a specific tube containing 0.5 mL of transport media solution, and sent on cold packs to the Locus Medicus laboratory for SARS-CoV-2 RT-PCR testing on the same day. All test results were recorded in the case report form including the RT-PCR Ct values.

The RT-PCR sampling was always carried out after self-sampling.

Part of the RT-PCR positive results will be sent to the typing laboratory for typing assay; to conform with the guidance document [3].

11. Results

11.1 Participant characteristics

A total of 578 subjects (122 were symptomatic and 456 were asymptomatic at time of presentation) were enrolled at four collection sites in Attica. Age and gender distribution of the 578 subjects is presented in Table 1 along with the positive rate per age group. Ages of subjects ranged from 9 years to 85 years.

Table 1. Age and gender distribution and positive rate (by CLUNGENE® COVID-19 Antigen Rapid Test) per age group

Age group (years)	Female	Male	Positivity rate % (total positive/total tested)
7-14	64	73	26.3% (36/137)
15-65*	227	179	19.5% (79/406)
>65	19	16	2.9% (1/35)
Total	310	268	20.1% (116/578)

* including 43 minors aged 15-17 years

11.2 Sensitivity and specificity

As showed in the Table 2, the CLUNGENE® COVID-19 Antigen Rapid Test showed a sensitivity of 95.1% (95%CI: 89.7%-97.7%) and a specificity of 100% (95%CI: 99.2%-100%) compared to gold-standard RT-PCR. Further analysis of sensitivity according to different ranges of Ct values was conducted, the sensitivity is much lower at Ct value range > 30, compare to ≤ 30, refer to Table 3 for details. Positive results are broken down by days post-onset of symptoms, refer to Table 4 for details.

30 positive clinical specimens (including 8 Alpha variant, 3 Beta variant and 19 Delta variant) were tested positive with the CLUNGENE® COVID-19 Antigen Rapid Test.

Table 2. Summary of the performance of the CLUNGENE® COVID-19 Antigen Rapid Test compared to RT-PCR

CLUNGENE® COVID-19 Antigen Rapid Test	RT-PCR		
	Positive	Negative	Total
Positive	116	0	116
Negative	6	456	462
Total	122	456	578
Sensitivity	95.1% (116/122) (95%CI: 89.7%-97.7%)		
Specificity	100% (456/456) (95%CI: 99.2%-100%)		

Table 3. Sensitivity according to different Ct value range (N gene specific for SARS-CoV-2)

Group	Number positive/total	Sensitivity	95%CI
Ct ≤ 25	74/74	100%	95.1%-100%
Ct ≤ 30	95/95	100%	96.1%-100%
Ct > 30	21/27	77.8%	59.2%-89.4%

Table 4: Sensitivity according to days post-onset of symptoms

Days post-onset of symptoms	RT-PCR positive	CLUNGENE® Rapid Test positive	Sensitivity	95%CI
0	79	77	97.5%	91.2%~99.3%
0~1	94	91	96.8%	91.0%~99.0%
0~2	100	96	96.0%	90.2%~98.4%
0~3	110	106	96.4%	91.0%~98.6%
0~4	114	110	96.5%	91.3%~98.7%
0~5	118	114	96.7%	91.6%~98.7%
0~6	121	115	95.0%	89.6%~97.7%
0~7	122	116	96.7%	89.7%~97.7%
Total	122	116	96.7%	89.7%~97.7%

11.3 Usability

Among 578 participants, 574 participants' questionnaires were evaluated in the usability study (some critical processes on 4 questionnaires were not recorded). Table 5 summarizes the individual steps of self-sampling and self-testing with the proportion of participants who precisely followed the instructions for use.

Table 5. The relevant steps of self-sampling and self-testing with numbers of participants who precisely followed the instructions

Processes		Participants following precisely instructions	Note
1. Self-sampling			
1.1	By opening the pouch, the swab-tip was not touched by hands (N=574)	571 (99.5%)	3 participants were aware of this, but found it difficult not to touch the swab-tip
1.2*	The depth of insertion of the swab into left nostril should be about 2.5 cm (N=574)	573 (99.8%)	1 participant did not insert the swab deep enough
1.3*	At least 5 times rotation to rub against the left nasal wall (N=574)	572 (99.7%)	2 participants rotated 4 times
1.4*	Both nostrils should be sampled (N=574)	574 (100%)	

1.5*	The depth of insertion of the swab into right nostril should be about 2.5 cm (N=574)	572 (99.7%)	2 participants did not insert the swab deep enough
1.6*	At least 5 times rotation to rub against the right nasal wall (N=574)	570 (99.3%)	3 participants rotated 4 times, 1 participant rotated 3 times.
2.	Self-testing		
2.1*	The swab was rotated at least 5 times in extraction process (N=574)	570 (99.3%)	1 participant rotated 4 times, 3 participants rotated 3 times.
2.2*	Leaving the swab tip in the extraction reagent for 1 minute (N=574)	573 (99.8%)	1 participant left the swab tip in the extraction reagent less than 1 minute
2.3	The swab-tip was squeezed during the removal from the extraction tube (N=574)	572 (99.7%)	2 participants forgot to squeeze, or only squeezed very lightly
2.4	Covered the tube tightly with the nozzle cap (N=572)	571 (99.8%)	1 participant forgot to cover the tube or covered it un-tightly; 2 unfilled
2.5*	3 drops applied (N=574)	572 (99.7%)	1 participant applied 4 drops; 1 participant applied 2 drops.
2.6*	Applied to the sample well (N=574)	574 (100%)	
2.7	Timing (N=574)	574 (100%)	
2.8*	Read test result at 15-20 minutes after sample application (N=574)	573 (99.8%)	1 participant read result at 10 minutes after sample application

The critical processes for self-sampling and self-testing are marked with an asterisk (*) in Table 5. The following errors were classified as potentially dangerous in terms of leading to a false result by the manufacturer:

- 1) Sampling with nasal swab was not carried out following instructions for use;
- 2) Leaving the swab tip in the extraction reagent less than 15 seconds when the swab is rotated at least 5 times;
- 3) Leaving the swab tip in the extraction reagent less than 1 minute when the swab is rotated less than 5 times;
- 4) Adding less than 2 drops to the sample well;
- 5) Reading the result before 10 minutes or after 30 minutes after sample application.

The following mistakes had been made that could lead to an incorrect result:

- 8 participants did not precisely follow the instructions of sampling
 - 2 participants did not insert the swab deep enough into one of their nostrils
 - 5 participants brushed the inside of one of their nostrils 4 or 3 times, less than 5 times
 - 1 participant did not insert the swab deep enough into right nostril and brushed the inside of right nostril 4 times, less than 5 times
- 1 participant rotated the swab less than 5 times and left the swab tip in the extraction reagent less

than 1 minute

In total, 11 errors were made by 9 participants that could potentially lead to an incorrect result. 98.4% (565/574) of the participants were able to perform the test in a manner that does not cause a safety hazard.

5 participants incorrectly read positive results as invalid results; 11 participants incorrectly read negative results as invalid results. 97.2% (558/574) of the participants were able to read test results correctly.

96.2% (552/574) of the participants could correctly interpret what to do next in case of a positive/negative/invalid test result. 22 participants felt difficult to find or explain the results.

The following three questions were used to evaluate whether participants understood the instruction for use, and 89.9% (516/574) of the participants answered all questions correctly.

Questions	Correct	Incorrect	don't know
At what temperature should the test be performed?	522 (90.9%)	45 (7.8%)	7 (1.2%)
When should the test be performed after removing the test cassette from the pouch?	560 (97.6%)	0	14 (2.4%)
How can you tell that the test result is invalid?	557 (97.0%)	11 (1.9%)	6 (1.1%)

The statistical results of the usability study are summarized in the table below:

No.	Acceptance criteria	Result	Evaluation
1	At least 80% of participants can perform the test in a manner that does not cause a safety hazard	98.4%	Passed
2	At least 90% of the participants can read test results correctly	97.2%	Passed
3	At least 80% of the participants can correctly interpret what to do next in case of a positive/negative/invalid test result	96.2%	Passed
4	At least 80% of the participants can understand the instructions for use	89.9%	Passed

97.7% (561/574) of the users were satisfied with the product (very good n=494, good n=67), 13 users did not comment on the satisfaction of the product. However, 5 users found it difficult to open the hole on the box, and 5 users found it difficult to tear off the sealed foil film on the extraction reagent tube.

12. Conclusion and discussion

The clinical performance and usability of CLUNGENE® COVID-19 Antigen Rapid Test successfully meet the acceptance criteria specified in section 4. Notably, the CLUNGENE® COVID-19 Antigen Rapid Test meet the acceptance criteria of >80% sensitivity and >98% specificity defined by the Medical Device Coordination Group (MDCG) in August 2021 [3]. And the performance of CLUNGENE® COVID-19 Antigen Rapid Test is not affected by Alpha, Beta, Gamma, Delta variants.

The 6 false negatives shown in Table 2 involved participants who had no critical deviations in self-use, and whose paired nasopharyngeal swabs with RT-PCR Ct values >30. In contrast to RT-PCR, which

amplifies the virus target sequences, antigen rapid tests detect the presence of viral antigens in the specimen without amplification. As a result, the antigen rapid tests show a lower sensitivity compared to RT-PCR test. The CLUNGENE® COVID-19 Antigen Rapid Test performed well (sensitivity of 95.1%) in early symptomatic cases (within the first 7 days following the onset of symptoms), which is higher than most published studies on other antigen rapid tests for nasal swab (74.2%-97%) [4-10].

All of the deviations in self-use summarized in Table 4 occurred in PCR-negative participants, therefore it could not be observed whether these deviations would lead to false-negative results. 11 errors (sampling n=9, specimen extraction n=2) were made by 9 participants that could potentially lead to an incorrect result, according to the potential dangerous classified by manufacturer. Furthermore, we observed that some participants did not have enough patience to read the instructions for use, resulting in incorrect readings of the results and incorrect answers to questions about the instructions for use. These errors might be reduced by modified instructions for use, such as follows:

- 1) The depth of insertion of the swab into the nostril is recommended to be marked in the illustration;
- 2) The number of swab rotations in the illustrations of sampling and extraction is suggested to be changed to a more visible colour, e.g. red;
- 3) Add symbols of “+”, “-” and “?” to the illustrations of positive, negative and invalid test results respectively, which may help lay users understand the test results more visually;
- 4) Bold is recommended for important sentences in the instructions for use.

In conclusion, we demonstrate that individuals aged 15 years or older can reliably perform the CLUNGENE® COVID-19 Antigen Rapid Test by themselves, and the adult lay users can reliably test another person under 15 years of age.

The CLUNGENE® COVID-19 Antigen Rapid Test for self-testing was placed on the market for the first time in Germany under the special approval by the BfArM (No. 5640-S-168/21), and has been widely used by laypersons in schools, companies and homes for self-testing.

In a study performed by Lindner et al. [11], a clinical testing situation was compared with an at self-testing situation. The clinical performance of the SARS-CoV-2 Antigen Self Test Nasal for patient self-testing was evaluated using nasal swab samples collected from 146 lay person in a prospective study at a clinical centre in Germany, sensitivity of self-testing was compared with the gold standard method (RT-PCR). The Ag-RDT evaluated was the STANDARD Q COVID-19 Ag Test (SD Biosensor, Inc. Gyeonggi-do, Korea). The sensitivity was found to be 82.5% (95% CI 68.1-91.3) and specificity was 100% (95% CI 96.5-100). In this study, the agreement of results between a self-test and a test performed by health professionals was assessed as well. Good consistency between self-test results and professional test results. The positive percent agreement was 91.4% (95% CI 77.6-97.0), while the negative percent agreement was 99.1% (95% CI 95.0-100). Most participants (80.9%) considered the Ag-RDT as rather easy to perform.

The COVID-19 rapid antigen tests for self-testing are easy to use and offer rapid results at low cost, especially it has a performance closer to RT-PCR. The tests can contribute to more efficient interruption of transmission through more timely identification of positive cases.

Questionnaire

for lay user study with CLUNGENE COVID-19 Antigen Rapid Test;

- used for the observer who is responsible for all the onsite processes including documentation/recording, **BUT** without intervention processes those as lay user should go through with, e.g. no hints on how to collect specimen properly; nor remind the volunteer "it's time to read your results, Sir";
- the questions are drawn from instructions for use (IFU), most from chapter [Step-By-Step Instructions], it's possible to refer to the instructions with the indexes.
- For volunteers over 65 years old, if they seek assistance in performing test, delivery helping by the observer to complete the testing, and **record** the processes in the last part of this questionnaire, including but not limited why he/she need helps, how the testing was proceed, what were the problems/difficulties for him/her with the study (by reading the IFU? by sample collection?....)? Be noticed that, as one of the basic principles, there should be NO help for volunteers with age 15~65.
- After the volunteers were introduced with the procedures of the study, and If there are no more questions, give the CLUNGENE COVID-19 Antigen Rapid Test to them.

Personal information of the participant:

Gender: M W

Age: _____ years (note: If the volunteer is minor under 15, the test is then performed by an adult, please confirm here)

Participant ID: _____

Has the participant ever used an IVD (in vitro diagnostic products) or self-testing IVD kit?

No; Yes, the IVD product was _____

Was it correctly conducted by general preparation processes as following:

- Was it easy for him/her to open the sealed foil film on the extraction reagent tube? [1.]
 Very easy; ok; not easy
- Was it easy for him/her to press a hole on the box and insert the tube into the box? [2.]
 Very easy; ok; not easy; did not recognize it

Was it correctly conducted by collection the specimen with the swab? [3, 4, 5]

- by opening the pouch, the swab-tip was not touched by hands (this is mentioned in the IFU)? [3. a.]
 Well done and no-touching of the swab-tip;
 He/she was aware of this, but it is difficult not to touch the swab-tip;
 He/she has no idea about the requirement and touched the tip unconsciously
- The depth of insertion of the swab into left nostril should be about 2.5 cm (1 inch); [4. a.]
 well done with the insertion; did not insert the swab deep enough
- at least 5 times rotation to rube against the left nasal wall. [4. b.]
 well done with 5 times rotation;
 not following the procedure, he/she rotated _____ times
- Both nostrils should be sampled.
 well done with both nostrils; only one side of nostrils was sampled
- The depth of insertion of the swab into right nostril should be about 2.5 cm (1 inch); [5. a.]
 well done with the insertion; did not insert the swab deep enough
- at least 5 times rotation to rube against the right nasal wall. [5. b.]
 Well done with 5 times rotation;

- not following the procedure, he/she rotated _____ times

Was it correctly conducted by the extraction processes with the extraction reagent: [7. 8.]

- The swab was rotated at least 5 times? [7. a.]
 - Well done with rotation;
 - Not following the procedure, he/she rotated _____ times

- Leaving the swab tip in the extraction reagent for 1 minute? [7. b.]
 - Well done with 1 minute incubation;
 - Not following the procedure, he/she kept the incubation time only about _____ seconds.

- The swab-tip was squeezed during the removal from the extraction tube? [8. a.]
 - Well done with squeezing;
 - He/she forgot to squeeze, or only squeeze very lightly

- Was it correct by covering the tube tightly with the provided cap? [8. b.]
 - Well done with covering the tube;
 - He/she forgot to cover the tube; or cover it un-tightly

from: ____:____ to: ____:____
approx.: _____ mins

Was it correctly conducted by operation of the test including reading results: [10. 11. 12.]

- Was it correct by application the specimen with 3 drops? [10. b.]
 - Well done with application 3 drops;
 - Not following the procedure, he/she dropped _____ drops

- Was it correctly applied to the sample well? [10. b.]
 - Well done with application;
 - He/she feel difficult to apply the reagent to the sample well, due to _____

- Timing [11.]
 - Well done with timing;
 - He/she deliberately decide not to set a timer

- Was the result read within the right time window (15~20 minutes after sample application)? [12.]
 - Well done with the time-window;
 - He/she read the result before the time window:
_____ minutes before
 - He/she read the result after the time window:
_____ minutes after

- Was it the result read by the user correct?
 - Positive/ negative/ invalid by the user; result read by the observer: _____

from: ____:____ to: ____:____
approx.: _____ mins

Does he/she know, what to do next if his/her result is positive/negative/invalid (he/she could reference the instruction for use, then he/she should explain them to the observer correctly):

- Were the interpretations correct?
 - Yes, exactly the right answer;
 - No, he/she feel difficult to find or explain the results

- Was it easy with the explanation/interpretation of the results?
 - Very easy; ok; not easy
